

Hosting the HopCharge HR Dashboard on the EVQ Technologies AWS Server

Information, credentials, and access I need from you (my manager) to deploy and run the HR BAU Automation Dashboard on our existing AWS server — safely, alongside the current website.

PREPARED FOR
Reporting Manager

PREPARED BY
HR Automation (Intern)

STATUS
Awaiting inputs

Purpose of this document. I want to host the HR Dashboard myself on the same AWS server that already runs the **EVQ Technologies** website, without disturbing that site. To do that safely I need a set of access details, credentials, and a few decisions from you. Everything I need is listed below, grouped by area, with a note on *why* each item is required. Please fill the “✓” column (or reply against each item) so I can begin.

What is being hosted? The HopCharge HR Dashboard is a **Python (FastAPI + Uvicorn) web application**. It listens on a local port (currently **8000**) and serves a browser dashboard used by HR to parse resumes, track candidates/forms, view analytics, and send recruitment emails. It connects out to a **Neon PostgreSQL** cloud database and to **Google APIs** (Forms/Drive) and **Gmail SMTP**. On the server it will run as a background service behind the existing web server (Nginx/Apache) as a reverse proxy.

1 AWS Server Access

So I can log in to the server, install the app, and run it.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Server public IP / hostname e.g. 13.234.x.x or ec2-13-234-x-x.compute.amazonaws.com	To connect to the server (SSH) and later point the domain to it.	Critical
☐	SSH login method — the .pem key file (or username + password), and the SSH username e.g. ubuntu / ec2-user, plus port (usually 22)	SSH is the only way to access and configure a headless cloud server.	Critical
☐	sudo / administrator rights confirmation	Installing Python, system packages (Tesseract), and configuring the web server all require admin access.	Critical
☐	Operating system & version e.g. Ubuntu 22.04 / Amazon Linux 2023	Determines the exact install commands and package names I use.	Important
☐	Server capacity — vCPU, RAM, free disk e.g. 2 vCPU / 4 GB RAM / 20 GB disk	The parser uses spaCy (NLP) and OCR, which need RAM/CPU headroom. I need to confirm there is room beside the existing site.	Important

2 Existing Website & Server Environment

So I can add the dashboard without breaking the EVQ Technologies site already running there.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Which web server is running — Nginx or Apache — and its config location e.g. /etc/nginx/sites-available/	I will add the dashboard as a new reverse-proxy entry in the <i>same</i> web server, so I must know which one and where.	Critical
☐	Ports already in use typically 80/443 for the website	To pick a free internal port for the dashboard and avoid a clash with the live site.	Important
☐	How the existing site is managed systemd service, Docker, PM2, or static files	I will follow the same pattern for the dashboard so the server stays consistent and maintainable.	Important
☐	Preferred install location for app files on the server e.g. /var/www/ or /opt/	To keep files organised where you expect them and where backups already run.	Optional
☐	OK to install system packages? Python 3.11+, Tesseract OCR	Confirmation that adding these to the shared server is acceptable.	Important

3 Domain & DNS

So the dashboard has a proper web address instead of a raw IP.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	The address the dashboard should live at e.g. hr.evtqtechnologies.com or dashboard.hopcharge.com	This is the URL HR will open. I need the exact subdomain you want.	Critical
☐	DNS provider & access Route 53, Cloudflare, GoDaddy, etc.	To create the DNS record pointing the subdomain to the server — either give me access, or add the record I specify.	Critical
☐	Public or internal-only? open to internet, or restricted to office IP / VPN	The dashboard shows sensitive HR data — this decides how I lock down access (see Section 8).	Critical

4 SSL / HTTPS Certificate

So the dashboard is served securely over HTTPS (padlock), not plain HTTP.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Certificate approach — may I use free Let's Encrypt (auto-renewing), or is there an existing/wildcard certificate to reuse?	Determines whether I generate a new cert or install one you provide.	Critical
☐	Existing certificate files (only if reusing one) .crt / .key / full chain	Needed to serve HTTPS on the chosen subdomain if a company cert is preferred.	If applicable

5 Network, Firewall & AWS Security Group

So incoming web traffic can reach the dashboard, and the server can reach the database.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Ability to edit the AWS Security Group (or have you open the ports I specify) e.g. 443 inbound; 80 for cert setup	AWS blocks all inbound traffic by default; the ports must be explicitly opened for users to reach the site.	Critical
☐	Allowed source IP ranges (if we restrict access) office/VPN IPs	If the dashboard is internal-only, I lock inbound access to these IPs.	Depends on \$3
☐	Outbound access is allowed from the server to the internet Neon DB, Google APIs, Gmail SMTP port 587	The app must reach external services; confirm no egress firewall blocks them.	Important

6 Database & Encryption Key

So the dashboard connects to the correct data and can read the existing encrypted employee records.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Production Neon PostgreSQL connection string (the pooled one, with – pooler) postgresql://...-pooler...neon.tech/neondb? sslmode=require	This is how the app reads/writes all HR data. Confirm we use the production database, not my test one.	Critical
☐	The employee-field encryption key (EMPLOYEE_FIELD_KEY)	Sensitive fields (PAN, Aadhaar, salary) are encrypted with this key. Without the exact key, existing records cannot be decrypted.	Critical
☐	Confirm the server IP is allowed in Neon (if IP allow-listing is on)	Neon can restrict which servers may connect; the new server IP may need adding.	If applicable

7 Third-Party Service Credentials

So the dashboard's integrations (Google Forms/Drive and outbound email) keep working on the server.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Google service-account JSON files — the production ones for Forms & Drive “Gforms service acc.json”, “Gdrive service acc.json”	Used to pull form responses and sync files from Google. Confirm these are the correct production credentials.	Critical
☐	Google Cloud project confirmation — required APIs enabled & the service accounts have access to the right Forms/Drive folders	If the service accounts lack access, the integrations fail silently on the server.	Important
☐	Sender Gmail address + Gmail App Password for outbound mail app password, NOT the normal login password; SMTP smtp.gmail.com:587	The dashboard sends recruitment/onboarding emails via Gmail SMTP. An App Password is required for programmatic sending.	Important
☐	Any other API keys / secrets the app is expected to use	To ensure nothing is missed during setup.	Optional

8 Application Access Control (important decision)

So sensitive HR data isn't exposed once the dashboard is reachable on the internet.

Please note: in its current form the dashboard has **no built-in login screen**, and it accepts requests from any origin. That is fine on a personal laptop, but once it is on a public server anyone with the URL could open it. Since it displays employee PII, I need a decision on how to protect it before go-live.

✓	DECISION NEEDED FROM YOU	OPTIONS I CAN IMPLEMENT	PRIORITY
☐	How should access be restricted?	(a) Restrict to office/VPN IPs only; (b) a login / password gate at the web-server layer; (c) both. I recommend (c).	Critical
☐	Who is allowed to use it? named HR users / an email list	To set up the credentials or IP allow-list correctly.	Important
☐	Exact site origin(s) to allow for the candidate status tracker STATUS_ALLOWED_ORIGINS / STATUS_PAGE_URL, e.g. https://hopcharge.com	To tighten cross-origin access from the current wide-open setting to only our real site.	Important

9 Operational & Ownership

So the dashboard keeps running reliably and someone owns its data and upkeep.

✓	WHAT I NEED	WHY IT IS NEEDED	PRIORITY
☐	Confirmation it should auto-start & auto-restart (run as a service)	So the dashboard comes back automatically after a reboot or crash.	Important
☐	Backup expectations — is the Neon database backed up, and do you want file/output backups?	To make sure HR data is recoverable.	Important
☐	Change/approval process — anyone to notify before I touch the shared server?	To avoid disrupting the live EVQ Technologies site during setup.	Optional
☐	A short maintenance window for the initial deploy	Some steps (web-server reload, cert issue) are safest in a low-traffic window.	Optional

10 Points of Contact

So I know who to reach if I get stuck on access I don't control.

✓	WHO	WHY	PRIORITY
☐	AWS account / server owner	For security-group changes, instance issues, or lost access.	Important
☐	Domain / DNS manager	To create the subdomain record if I don't have DNS access.	Important
☐	Person who maintains the EVQ Technologies site	To coordinate so I don't disturb their configuration.	Optional

★ The Absolute Must-Haves (to start)

1. **SSH access** — server IP, the .pem key (or user/password), and sudo rights.
2. **Which web server** is running (Nginx/Apache) and confirmation I can add a reverse-proxy entry.
3. **The subdomain** to use + DNS record created (or DNS access).
4. **Go-ahead for HTTPS** via Let's Encrypt (or the existing certificate files).
5. **Permission to open the required port** in the AWS Security Group.
6. **Production database connection string** and the EMPLOYEE_FIELD_KEY.
7. **Production Google service-account files** and the sender Gmail + App Password.
8. **A decision on how to lock down access** (IP allow-list and/or a login gate).
